

MYCETES

(ISO DIS 16212:2007)

In microbiology, the term "mycetes" generally indicates the moulds and the yeasts, which are microorganisms that can compromise the cosmetic product quality and can represent a possible cause of risk for the consumers.

For this reason, together with the determination of the bacteria count, the verification of the presence of these microorganisms in the cosmetic products constitutes a rapid, effective and economic control.

From these initial verifications, it could be even necessary to proceed with the research and the identification of possible pathogenic microorganisms, that can constitute a danger for the consumers' health.
